The claims remain pending with no amendment, and listings of claims in the application:

Listing of Claims:

1. (previously presented) A digital signature method to be performed by a computer based on braid group conjugacy problem, parameters involved in this method comprising a signatory (S), a signature verifying party (V), a message (M) needing signature, a braid group $B_n(l)$ divided into a left subgroup $LB_m(l)$ and a right subgroup $RB_{n-1-m}(l)$, an integer n for a number of generators in the braid group $B_n(l)$, an integer m for a number of generators in a left subgroup $LB_m(l)$, an integer l for an upper bound of a length of a braid, a one way hash function h from bit sequence $\{0,1\}^*$to braid groups $B_n(l)$; said signature method comprising the following steps of:

Step 1. the signatory (S) selecting a braid x generated from the left subgroup $LB_m(l)$, a second braid x' generated from the braid group $B_n(l)$, and a third braid a generated from the braid group $B_n(l)$, by the computer, wherein the computer is adapted to making them meet $x'=a^{-1}xa$, moreover, with known x and x', it being impossible to find a in calculation, and considering braid pair (x',x) as a public key of signatory (S), a as a private key of signatory (S);

Step 2. signatory (S) using hash function h for message (M) needing signature, by the computer, wherein the computer is adapted to get $y=h(M)$ from the braid group $B_n(l)$;

Step 3. generating a braid b from the right subgroup $RB_{n-1-m}(l)$ at random, by the computer, wherein the computer is adapted to signing the message (M) with the private key a and a generated random braid b to obtain $Sign(M)=a^{-1}byb^{-1}a$; and

Step 4. the signatory (S) outputting, by the computer, message (M) and a signature of message (M) $Sign(M)$.

2. (previously presented) The digital signature method based on braid group conjugacy problem according to claim 1, wherein generating the public key braid pair (x',x) and the private key braid a of signatory (S) in said step 1 comprises the following steps of:

Step 1a. selecting a distance d between system parameter braid groups public key pairs;

Step 1b. representing x into a left canonical form $x=\Delta^u\pi_1\pi_2\ldots\pi_l$;

Step 1c. selecting a braid b at random to belong to a set $B_n(5l)$

Step 1d. calculating $x' = b^{-1}xb$, $a=b$;

Step 1e. generating a bit at random, if 1, calculating $x' = decycling(x')$, $a = a\pi_l$; if not 1, calculating $x' = cycling(x')$, $a = a\tau^u(\pi_1)$;

Step 1f. judging whether x' belongs to $SSS(x)$ and whether $l(x') \leq d$, if all the conditions are yes, outputting the braid pair(x, x') as the public key, a as the private key; if either of them is not, performing step 1e.

3. (previously presented) The digital signature method based on braid group conjugacy problem according to claim 1, wherein the process for obtaining $y=h(M) \in B_n(l)$ by using the hash function h in said step 2 comprises the following steps of:

Step 2a, selecting an ordinary hash function H, with a length of output $H(M)$ is l $[log(2,n!)]$, then dividing $H(M)$ into l sections $R_1||R_2|| \ldots ||R_l$ in equal at one time;

Step 2b, corresponding Ri to a permutation braid Ai, then calculating $h(M) = A1*A2 \ldots Al$, that is the $h(M)$ required.

4. (previously presented) The digital signature method based on braid group conjugacy problem according to claim 1, wherein a integer n for the number of generators in a braid group is in the range of 20~30, an upper value of the braid length is $l=3$, $d=4$, and an left subgroup n-m=4.

5.-7. (canceled)

8. (previously presented) A method for digital signature to be performed by a computer configured to calculate data based on braid groups conjugacy problem and verification thereof, parameters involved in this method comprising a signatory (S), a signature verifying party (V), a message (M) needing signature, a braid group $B_n(l)$ divided into a left subgroup $LB_m(l)$ and a right subgroup $RB_{n-1-m}(l)$, an integer n for a number of generators in the braid group $B_n(l)$, an integer m for a number of generators in the left subgroup $LB_m(l)$, an integer l for an upper bound of a length of a braid, a one way hash function h mapped from bit sequence {0,1}*to braid groups $B_n(l)$; comprising the following steps of:

Step 1. the signatory (S) selecting a braid x generated from the left subgroup $LB_m(l)$, a second braid x' generated from the braid group $B_n(l)$, and a third braid a generated from the braid group $B_n(l)$, by the computer, wherein the computer is adapted to making them meet

$x'=a^{-1}xa$, moreover, with known x and x', it is impossible to find a in calculation, and considering braid pair (x',x) as a public key of signatory (*S*), a as a private key of signatory (*S*);

Step 2. signatory (S) using a hash function h for message (M) needing signature, by the computer, wherein the computer is adapted to get $y=h(M)$ from the braid group $B_n(l)$;

Step 3. generating a braid b from the right subgroup $RB_{n-1-m}(l)$ at random, by the computer, wherein the computer is adapted to signing the message (M) with the private key a and the braid b generated randomly to obtain $Sign(M)=a^{-1}byb^{-1}a$;

Step 4. the signatory (*S*) outputting, by the computer, the message (*M*) and its signature *Sign(M)* to the signature verifying party (*V*);

Step 5. the signature verifying party (*V*) obtaining, by the computer, the public key of signatory (*S*) after receiving the message (*M*) and the signature of message (*M*) *Sign(M)* transmitted from signatory (*S*);

Step 6. calculating message *M*, by the computer, wherein the computer is adapted to calculate message M by employing a system parameter hash function h, to obtain $y=h(M)$;

Step 7. judging whether *sign(M)* and y are conjugate or not, by the computer, wherein the computer is adapted to perform the judging; if not, *sign(M)* is an illegal signature, the verification fails; if yes, perform step 8; and

Step 8. calculating *sign(M)* x' and xy, by the computer, wherein the computer is adapted to calculate *sign(M)* x' and xy by using the obtained public key of signatory (S), and judging whether they are conjugate or not, if not, *sign(M)* is an illegal signature, and the verification fails; if yes, *sign(M)* is a legal signature of message (M).

9. (previously presented) The method according to claim 8, wherein generating the public key braid pair (x',x) and private key braid a of signatory (S) in said step 1 comprises the following steps of:

Step 1a. selecting a distance d between system parameter braid groups public key pair;

Step 1b. representing x into left canonial form $x=\Delta^u\pi_1\pi_2\ldots\pi_l$;

Step 1c. selecting a braid b at random to belong to set $B_n(5\ l)$

Step 1d. calculating $x'=b^{-1}xb, a=b$;

Step 1e. generating a bit at random, if 1, calculating $x'=decycling(x'), a=a\pi_l$; if not 1, calculating $x'=cycling(x'), a=a\tau^u(\pi_1)$; and

Step 1f. judging whether x' belongs to *SSS(x)* and whether $l(x') \leq d$, if all conditions are yes, outputting the braid pair(x, x') as the public key, *a* as the private key; if either of them is not, performing step 1e.

10. (previously presented) The method according to claim 8, wherein the process for obtaining $y=h(M) \in B_n(l)$ by using hash function *h* in said step 2 comprises the following steps of:

Step 2a. selecting an ordinary hash function *H*, with a length of its output *H(M)* is $l\,[\log(2,n!)]$, then dividing *H(M)* into *l* sections $R_1||R_2||\ \ldots\ ||R_l$ in equal at one time; and

Step 2b. corresponding *Ri* to a permutation braid *Ai*, then calculating $h(M) = A1*A2 \ldots Al$, that is the *h(M)* required.

11. (previously presented) The method according to claim 8, wherein *n* for the number of the generation braids in the braid group is in the range of 20~28, an upper value of the braid length is *l=3, d=4,* and an left subgroup *n-m*=4.

12. (previously presented) The method according to claim 8, wherein algorithm *BCDA* is employed in judging whether *sign(M)* and *y* are conjugate or not in step 7 and judging whether *sign(M) x'* and *xy* are conjugate or not in step 8.

13. (previously presented) The digital signature method based on braid group conjugacy problem according to claim 2, wherein a integer n for the number of generators in a braid group is in the range of 20~28, an upper value of the braid length is l=3, d=4, and an left subgroup n-m=4.

14. (previously presented) The digital signature method based on braid group conjugacy problem according to claim 3, wherein a integer n for the number of generators in a braid group is in the range of 20~28, an upper value of the braid length is l=3, d=4, and an left subgroup n-m=4.

15. (previously presented) The method according to claim 9, wherein n for the number of the generation braids in the braid group is in the range of 20~28, an upper value of the braid length is l=3, d=4, and an left subgroup n-m=4.

16. (previously presented) The method according to claim 10, wherein n for the number of the generation braids in the braid group is in the range of 20~28, an upper value of the braid length is l=3, d=4, and an left subgroup n-m=4.
